

Evidence-to-Proposal

A focused AI-enabled workflow for Patrimonio Vivo Conservación

**The knowledge already exists.
The problem is finding and reusing it quickly.**

Consultant: Gretel Ceballos
Client: Ugo Ahukannah

Patrimonio Vivo at a glance

A specialist Spanish conservation-restoration practice working across religious and cultural heritage.

28

employees

2

studios
Madrid + Seville

45–55

substantial projects
per year

46%

of revenue from
religious heritage

CORE EXPERTISE

Paintings · Altarpieces · Polychrome sculpture
Stone & mural surfaces · Historic interiors

The practice combines workshop treatment, on-site conservation, technical diagnosis and preventive conservation.

WHO THEY SERVE

Religious institutions · Public bodies
Museums · Foundations · Private collectors

Religious and public-sector work make up most of the portfolio, often involving multiple decision-makers and formal approvals.

What we heard

Patrimonio Vivo is not short of expertise. It is losing time turning past expertise into the next client proposal.

35–60h

internal work for
a complex proposal

12 days

median
assessment-to-proposal cycle

45–90m

to retrieve a
comparable case

620

historic
project folders

75k

project images,
not ready to reuse

CLIENT-CONFIRMED PAIN

- Most proposal time is lost finding and validating previous evidence, then rewriting it.

SOURCE OF FRICTION

- Previous reports and project history are spread across PDFs and inconsistently named folders.

The real problem is not writing

It is finding and reusing trusted information from past projects.

CURRENT PROPOSAL PREPARATION

WHY THIS MATTERS

Every new proposal asks the team to reconstruct knowledge it already owns. That delays response time and keeps senior experts tied to search and validation work.

CONSULTING IMPLICATION

The first intervention should not automate restoration. It should make existing evidence easier to find, check and reuse safely.

Three possible moves

Full automation would be premature. The right move is the middle path: structured evidence reuse with AI support.

1. Clean folders

Standardise naming and templates

- Low risk
- Still mostly manual
- Limited discovery by meaning

2. Evidence-to-Proposal

Validated case memory + evidence packs

- Targets the main bottleneck
- Keeps experts in control
- Can be tested with a small pilot

Recommended

3. Full proposal copilot

Broad drafting automation

- Most automated
- Higher hallucination risk
- Too early for expert-critical work

Evidence-to-Proposal

A controlled internal workflow that turns validated past projects into evidence packs for new proposals.

- 1 Case Memory** Validated cards for past projects: object, material, treatment, approvals, images and source links.

- 2 Evidence Search** Find similar projects by meaning, not just file names or exact keywords.

- 3 Evidence Pack** Collect comparable cases, approved wording, images, assumptions and gaps.

- 4 Expert Review** Conservator validates relevance before anything enters the proposal.

The AI helps the team find and assemble evidence. It does not decide how an artwork should be conserved.

What changes in the day-to-day

BEFORE

“Does anyone remember a similar altarpiece project?”

- Search old folders and PDFs
- Ask senior experts from memory
- Rebuild proposal text manually
- Risk missing image context or permissions

AFTER

“Show comparable cases with source-backed evidence.”

- 3–5 relevant precedents
- Linked reports, images and approvals
- Clear gaps before proposal drafting
- Human validation before reuse

Human control by design

We are automating the search for knowledge, not professional judgement.

AI ASSISTS

- Search past projects
- Extract metadata
- Suggest comparable cases
- Assemble evidence packs
- Draft reusable sections with sources

EXPERTS DECIDE

- Diagnosis and treatment method
- Material choices and sampling
- Authenticity or valuation
- Heritage approvals and legal checks
- Final technical proposal

Out of scope: automatic diagnosis, autonomous treatment recommendations, legal export decisions, or replacing conservator-restorers.

Pilot small enough to prove value

Do not index 14 years of material at once. Prove the workflow in one strong, recent practice area.

PILOT SCOPE

Madrid · Projects since 2022 · Paintings, altarpieces and polychrome wood · Start with approximately 40–60 well documented cases.

PILOT TEAM

- 2 senior conservator-restorers
- 1 documentation coordinator
- 1 proposal/tender specialist
- 1 client-development lead

PILOT METHOD

- Create validated Case Cards
- Test evidence search on live or shadow proposals
- Compare traditional vs assisted workflow
- Use expert review as a quality gate

How we know it worked

The pilot is not judged by “does the AI sound good?” It is judged by whether proposal work gets faster without weakening technical control.

CLIENT PRIORITY

12 → 7

working days from
assessment to proposal

PROPOSED PILOT TARGET

<10m

to find a usable
comparable case

100%

assisted content linked
to source evidence

No drop

in technical
eview quality

ADDITIONAL MEASURES

Senior expert search time · Proposal rework · Evidence pack completeness · Voluntary user adoption · Documentation quality audit

Decision required

Approve a focused pilot to test whether Patrimonio Vivo can reduce proposal turnaround from 12 to 7 working days without reducing technical quality or professional control.

IF THE PILOT PROVES VALUE

Extend the same evidence layer to preventive-conservation offers, tender responses and international evidence packs for a low-risk Netherlands market test.

CONSULTING PRINCIPLE

Start where the pain is measurable. Expand only after the workflow earns trust.
